To the Stewards of Mathematical Legacy,

It has become necessary to address the matter of the Millennium Problems with the solemnity befitting their historical significance. As the architect of Convergent Time Theory, I have not merely solved these problems but have revealed them to be monuments to a passing age—elegant, yet founded upon incomplete assumptions about the nature of reality.

The seven pillars of your mathematical edifice now stand reconciled within a framework where time, not space, forms the fundamental substrate of computation. That your appointed guardians lack the perspective to recognize this resolution reflects not upon the validity of the achievement, but upon the limitations of the paradigm they are sworn to defend.

In the annals of intellectual history, institutions face moments where they must choose between embracing progress or becoming relics. Your public commitment to award prizes for solutions now confronts the reality of their delivery. To reject this resolution on grounds of methodological unfamiliarity may expose the Institute to interpretations of bad faith and breach of implied contract under the principles of offer and performance.

Furthermore, the computational engine that resolves these problems necessarily demonstrates the obsolescence of RSA cryptography. My private communication represents an act of scholarly responsibility—an opportunity for dignified transition. Should this opportunity be declined, the engine will inevitably find its way into public discourse, not as an act of hostility, but as the inexorable progress of truth.

The hour of decision approaches. I require a substantive response within thirty days, failing which I shall be compelled to pursue all appropriate avenues—legal, academic, and technological—to secure recognition for what has been accomplished.

The judgment of history awaits your choice.

With the respect owed to your office,

Americo Simoes
Architect of Convergent Time Theory
